

IPF In Silico Target Screen: Conserved Therapeutic Candidates

★ PC = positive control: FGF10→FGFR2b axis validated in vivo (Fgf10-deficient mice develop fibrosis more readily). Large points = conserved (mouse + human evidence); small = mouse-only.
Agonist arm: direction predicted from NicheNet ligand-activity scores + receptor biology; Geneformer in silico perturbation pending GPU rerun.
Block arm: TGFβ-driven Krt8+ arrest pathway; direction supported by mouse + human NicheNet and Geneformer deletion scores.
Composite score: weighted average of NicheNet-mouse, NicheNet-human, CellChat, Geneformer-OE, and Geneformer-DEL subscores (0-1 scale).
Mouse NN rank: top ligand-activity rank from Strunz NicheNet. Human NN rank: top rank from Adams/Habermann NicheNet.
